F2 — State transitions / routing (post-RC5)

```
start → data_quality

→ (geomechanics | skip if cheap precheck passes; criteria kept)

→ [extra_validation if R_data low / missing / imputed]

→ predict → uncertainty

→ critic (OOD / physics / set-edge / disagreement / validation)

→ if request_recheck: recheck_* → critic  (cycle++; limit=3)

→ non-convergence: critic_recheck_cycles ≥ 3 → forced abstain

→ safeguard: total loops ≥ max_loops(24) → forced abstain

→ finalize → fuse_assessment → decision bands + Critic escalate/downgrade

Hard gates: wide set + low stability; high disagreement; OOD∧weak physics

RC3: abstain keeps true R_final; decision_override_reason recorded (no 0.49 clamp)
```
